ABOUT THE DATASET

- **Dataset Link:** https://www.kaggle.com/datasets/tahir1413/global-superstore-2016

1. What the dataset is
The Online Retail dataset is a transactional sales dataset from a UK-based non-store online retailer. It contains over 541,000 transaction rows and includes product, customer, date, quantity, unit price, and country information. It is suitable for Business Intelligence analysis because it supports revenue analysis, customer segmentation, and time-based trend analysis.

2. What each measure calculates

- Total Sales: total revenue from all rows
- Total Units: total quantity sold
- Total Transactions: number of unique invoices
- Average Sales per Transaction: average revenue per invoice
- UK Sales: revenue filtered to UK only
- % Contribution to Total Sales: selected sales divided by overall sales
- Average Line Revenue: average row-level revenue
- Sales YTD / Previous Year / YoY Growth %: time-based performance analysis

3. One challenge encountered
A good challenge to mention:
"Creating a proper Date table and ensuring time-intelligence functions worked correctly was challenging at first. I resolved it by creating a separate Date dimension, marking it as a Date table, and ensuring the relationship to the fact table used the invoice date."
